HYLA CHRYSOSCELIS (Cope’s Gray Treefrog). USA: TEXAS: MUDINA Co.: 2601–2799 County Road 454, (29.35005°N, 98.99563°W; WGS 84). 30 July 2015. Jeffery Patrick Adams. Verified by Toby Hibbitts. Biodiversity Collections, University of Texas at Austin (TNHC 96605, photo voucher). A single adult individual was found traversing a residential yard on the east side of County Road 4514 at 0855 h. This is a new county record for Texas (Dixon 2013. Amphibians and Reptiles of Texas: with Keys, Taxonomic Synopses, Bibliography, and Distribution Maps. Texas A&M University Press, College Station, Texas, 447 pp.), and the first record of the species in Medina County. Microscopic examination of the interdigital membrane was necessary and submitted to Toby Hibbitts to differentiate this specimen from *H. versicolor*. This record extends its known distribution 48.46 km west of the closest known record from Bexar County (UTEH Herps H-8868). Subsequently, three additional adult *H. chrysoscelis* have been observed within the vicinity of the initial find and were recorded in the iNaturalist Herps of Texas database (#1823942, #1900783, and #1900788). These four Medina County specimens complete our understanding of this taxon’s distribution in part of the southwestern region of Texas, surrounded by other records from Atascosa, Bandera, Bexar, Frio, and Uvalde counties.

LEPTOPELIS BOULENGERI (Victoria Forest Tree Frog). GABON: OGOUÉ-IVOHO PROVINCE: Ivindo National Park, SW of Ipassa Research Station (0.506275°N, 12.797113°E, WGS 84), 546 m elev. February 2011. P. Carlino. Verified by A. Durante. Museo di Storia Naturale del Salento, Calimera (MSNS-Amph 75). Individual (SVL = 40.4 mm) found at night on a leaf at 1 m above forest floor. First record for Ivindo National Park. Closest records in Gabon are from Moukalaba-Doudou National Park and Loango National Park, ca. 230 and 260 km SW of Mount Ibounjdi respectively (Pauwels and Rödel 200, *op. cit*). Specimens collected under permits AR0002/11/MENEST/FPRSCJS/CENAREST/C/CG/CST/CSAR and AR0049/12/MENEST/FPRSCJS/CENAREST/C/CG/CST/CSAR.

LITHOBATES SEPTENTRIONALIS (Mink Frog). USA: MAINE: WALDO Co.: unnamed boggy pond ca. 2 km NW of Dutton Pond in the town of Knox (44.50424°N, 69.168571°W; NAD 83), 180 m elev. 19 June 2015. Phillip G. deMaynadier and Trevor B. Persons. Verified by Greg Watkins-Colwell. Yale Peabody Museum of Natural History (YPM 15890). New county record, and now the southeastern most documented occurrence in the species geographic range. Extends known distribution 63 km ESE of Mercer, Somerset County and 70 km SSE of Bradford, Penobscot County (Hunter et al. 1999. Maine Amphibians and Reptiles. University of Maine Press, Orono, Maine, 252 pp.). The only previous report from Maine's coastal ecoregions, a specimen (YPM 6373) collected 87 km E of the Knox locality in the Tunk Lake region of Hancock County and mapped in Hunter et al. (*op. cit*), is a misidentified juvenile *L. catesbeianus*. However, independent unverified reports of *L. septentrionalis* from that location suggest it may occur there. Adult specimen collected under Maine Department of Inland Fisheries and Wildlife permit (#2015-259) issued to TBP. Thanks to Greg Watkins-Colwell for verifying identifications and photographing the purported Hancock County specimen (*L. catesbeianus*).
